INSPECTION OF COMMERCIAL FEEDING STUFFS

ANALYSES OF COMMERCIAL FEEDING-STUFFS COLLECTED BY THE COMMISSIONER OF AGRICULTURE IN 1920.

This report deals with the analyses of three hundred and forty samples of commercial feedstuffs which were collected during the year under the direction of the Commissioner of Agriculture, Mr. Andrew L. Felker. Mr. E. D. Sanborn visited nearly every town in the state and collected samples from most of the feed dealers.

With a few exceptions, the feeds were of good quality and very similar to those of last year. The cottonseed meals were lower in protein and somewhat more inferior in quality than they were a few years ago. The flaxseed meals averaged almost three per cent lower in protein than last year. The gluten feeds were superior in quality to those of last year. There was a decided increase in the number of wheat feeds this year and their quality was similar to that of last year.

Co-operation with the Federal Bureau of Chemistry.

The State law cannot effectively protect the purchaser who buys directly from a manufacturer outside of the State inasmuch as the State powers of regulation are limited to sales within the State. For this reason coöperative arrangements were made with the Federal Bureau of Chemistry in the fall of 1919 and carried out during the past year. In cases where interstate shipments are found to be misbranded or adulterated, the findings of the State Department are reported to the federal authorities, who then carry out the necessary legal pro-

ceedings. This gives a great deal of additional protection to the feed purchasers of the State.

Sliding Scale or Double Guarantee.

The law definitely provides that the manufacturer shall state only the minimum percentage of protein, fat and carbohydrates upon the guarantee. The object of this is to prevent the purchaser from being misled by a double guarantee. For example, without this provision in the law, when a guarantee shows 30 per cent to 45 per cent protein, an analysis of 30 per cent is all that is necessary to meet the guarantee, although the guarantee may lead the purchaser to believe that he may get close to 45 per cent, when as a matter of fact he is more apt to get 30 per cent, or even less. The last year has shown a marked improvement in this regard. In 1919, out of 306 samples analyzed, 34, or 11 per cent, had a double guarantee, while in 1920 out of 340 samples only 21, or 6 per cent, had a double guarantee. These cases were brought to the attention of the manufacturer and in most cases old tags had been used. All of these manufacturers have promised to comply with the law in the future.

Classification of Feedstuffs Analyzed.

In classifying these feedstuffs we have used the class name under which they have been sold. The following table shows the number of feeds in each class, the average per cent of protein and fat found and the price per 100 lbs.

TABLE NUMBER 1.

Class.	No. of Feeds.	Average Percent. Protein	Average Fat Percent.	Price per 100 lbs.
Alfalfa Meals	2	14.84	2.17	3.12
Beet Pulps	6	8.94	0.66	3.07
Brewers Dried Grains	2	17.71	6.89	3.45
Calf Meals	4	23.83	7.21	5.02
Compounded Feeds	50	13.12	4.06	3.60
Cottonseed Meals	15	34.66	6.93	4.07
Dairy Feeds	28	22.55	5.28	3.90
Flaxseed Meals	7	31.73	6.68	4.38
Gluten Feeds	7	27.27	3.65	3.95
Hog Feeds	2	27.40	6.14	3.87
Hominy Feeds	6	10.86	5.88	3.56
Miscellaneous	4	20.70	5.00	3.78
Molasses Feeds	3	11.02	2.83	3.42
Oat Feeds	3	7.04	2.31	2.03
Poultry Feeds	37	25.34	6.17	4.53
Wheat Feeds	164	16.11	4.50	3.14
Total	340			

Deficiencies in Analyses.

The following table shows the number of samples found deficient in protein and in fat, and the number of samples deficient in both protein and fat, and also the percentage number of each class showing deficiencies. In making up the table, only those deficiencies of one half of one per cent or more of protein and one fourth of one per cent or more of fat were used.

Class.	No. in Class.	No. Def. ½ % Protein.	No. Def. ¼ % Fat.	No. Def. both Protein and Fat.	Per cent Def. ½ % Protein.	Per cent Def. ¼ % Fat.	Per cent both Protein and Fat.
Alfalfa Meals	2	0	0	0	0	0	0
Beet Pulps	6	2	0	0	0	0	0
Brewer's Dried Grains	2	2	1	1	100	50	50
Calf Meals	4	0	0	0	0	0	0
Compounded Feeds	50	7	13	4	14	25	8
Cottonseed Meals	15	6	1	0	4	6	0
Dairy Feeds	28	5	3	2	18	11	7
Flaxseed Meals	7	4	0	0	0	0	0
Gluten Feeds	7	0	0	0	0	0	0
Hog Feeds	2	0	0	0	0	0	0
Hominy Feeds	6	0	0	0	0	0	0
Miscellaneous	4	2	1	1	50	25	25
Molasses Feeds	3	0	1	0	0	33	0
Oat Feeds	3	0	0	0	0	0	0
Poultry Feeds	37	4	5	2	11	14	5
Wheat Feeds	164	10	5	1	6	3	1
	340	42	30	11	12	9	3

What Does the Chemical Analysis Mean?

In a feed analysis the following determinations are usually made: protein, fat, carbohydrates, ash, moisture and crude fiber.

Protein is determined by finding the percentage of total nitrogen and multiplying this by the factor 6.25, since it has been found that the average proteins contain 16 per cent nitrogen. While this includes small amounts of certain other compounds which contain nitrogen, for all practical purposes it is sufficiently accurate. Protein, then, is made up of the compounds in the feed which contain nitrogen.

Fat is determined by extracting a dried sample of the feedstuff with ether and weighing the residue after the ether is driven off. In main it contains the vegetable fats of which olive oil, linseed oil, peanut oil, and cottonseed oil are examples. It contains also small amounts of clorophyll (the green coloring matter of leaves), waxes and resins, etc.; but for practical purposes it is accurate enough to deal with it as fat.

Ash is determined by weighing the residue after the feedstuff has been burned at a low temperature. It contains the mineral matter of the feedstuff.

Moisture is determined by finding the loss in weight after heating at the temperature of boiling water. It shows the amount of water that the feed contains.

Carbohydrates are determined by adding the percentage of protein, fat, moisture, and ash and subtracting it from 100. The carbohydrates are composed largely of starches, sugars, pentosans, celluloses, etc. The carbohydrates include the crude fiber also. The percentage of carbohydrates less the percentage of crude fiber is called the *nitrogen free extract.*

Crude Fiber is made up of the more woody-like carbohydrates, which are largely of cellulose nature. Pure cotton is an example of almost pure cellulose. Wood, straw, corn fodder, etc., are materials which are high in crude fiber content.

Value of the Analysis.

The analysis enables the purchaser to buy and use his feeds in the most economical way, by aiding him to determine:

1. The comparative value of different feeds in dollars and cents.
2. Whether the feed is of high or low quality.
3. Whether the feed is of the type which meets his needs.
4. How to balance his rations.

What Are Foods for Animals?

In order that an animal may continue to live even without making growth or producing wool, eggs, milk or work, etc., there are certain food materials which it must have. The animal must have a certain amount of protein, fat, carbohydrates,

water and mineral constituents. In addition there are other things, known as "vitamines," "growth promoting substances," or "food accessories," the chemical nature of which is not well understood, which are necessary. The latter substances, however, are usually present in sufficient quantities in our regular feeding stuffs and we need consider them no further. Our feedstuffs usually contain mineral matter sufficient for the needs of an animal with a few exceptions, such as calcium carbonate, which we furnish, as oyster shells for hens, so we need not consider the mineral matter further.

The protein, fat and carbohydrates must be furnished in the feed and since they are expensive and their content in feeds largely determines its feeding value, we should consider their use in the animal.

The Functions of Foods in the Animal.

Carbohydrates, protein and fat are sometimes called food nutrients. These nutrients have two definite uses in the animal body.

First, they furnish building materials to produce new tissues in the growing animal, to repair the waste in tissues of the animal, and to make products such as milk, eggs, wool, etc.

Second, they furnish (by being burned in the body) energy to maintain body heat and to do work. All animals require energy for their life processes. They require energy to move about, to digest their food and to maintain their body temperature.

All three of the food nutrients can be used to furnish energy, but the energy value per pound and the cost per pound is not the same. Not all can be used to build up all parts of body tissues. Protein is definitely required for certain building uses. For these reasons a knowledge of the uses of each nutrient will aid the practical feeder.

The Function of Protein.

The proteins form an essential part of every living cell. All animals must secure their protein from the protein of foods.

They cannot make it from the more simple inorganic compounds, as plants do. Protein in main forms the muscular tissues, hair, hoofs, horns, etc. Milk and eggs contain large quantities of protein. The young growing animal or the one producing milk or eggs requires more protein than the mature animal or the one which is not producing materials. When a surplus of protein above the needs of the animal is fed it does not store protein but burns it to produce heat or converts a part of it into fat. This is an expensive source of energy or fat, however, inasmuch as carbohydrates which are less expensive can furnish this need.

The Functions of Fat.

Fat is burned in the animal body to furnish energy as heat or muscular work or is stored in the animal as body fat. Although one pound of fat is equivalent to 2.25 pounds of carbohydrates in energy value, the fat is more expensive and is next to protein in cost.

The Functions of Carbohydrates.

Carbohydrates are burned in the body to furnish heat or energy for work and also may be converted into fat and stored as body fat. Carbohydrates are cheaper than protein and fat.

Analysis Alone Not Sufficient to Determine Value of Feed.

Not all of the protein, carbohydrates and fat in the different feedstuffs are digested. In comparing the value of different feedstuffs, especially when they are of different types, we must take into consideration the digestibility of these food nutrients. The *coefficient of* digestibility is a term which expresses the percentage amount of the food nutrients which are digested and absorbed by the animal. These coefficients are determined by careful feeding experiments which are conducted by the various experiment stations. Table Number 3 gives a summary of the average results for some of our common feedstuffs.

TABLE NUMBER 3.

Average Digestibility of Feeding Stuffs, with Ruminants Expressed in Percentages.

(Taken from "Feeds and Feeding" by Henry and Morrison.)

	Dry matter.	Protein.	Crude Fiber.	Nitrogen free Extract.	Fat.
Corn Meal	90	74	57	94	93
Gluten meal	88	85	55	90	93
Gluten feed	86	85	76	88	85
Hominy feed	83	66	76	90	91
Wheat bran	65	78	31	72	68
Standard wheat middlings	..	77	30	78	88
Barley	88	78	56	92	78
Oats	70	78	35	81	87
Buckwheat	71	75	24	76	100
Soybean meal	..	92	99	100	68
Linseed meal (old process)	79	89	57	78	89
Linseed meal (new process)	81	86	73	87	95
Cottonseed	66	68	76	50	87
Cottonseed meal	77	84	37	75	95
Cottonseed feed	56	58	45	61	90
Dried brewer's grain	61	81	49	57	89
Dried beet pulp	75	52	83	83	..
Molasses feeds	68	61	50	79	100
Flesh meal	..	93	..	..	98
Fish meal	71	78	..	..	100
Timothy hay	55	48	50	62	50
Barley hay	59	65	62	63	41
Oat hay	54	54	52	56	61
Alfalfa	60	71	43	72	38
Red clover	59	59	54	66	57
Corn silage dent immature	64	53	68	66	71
Corn silage dent mature.	66	51	65	71	82

We have this data for the pure grains and feeds, but because the various proprietary feeds are not standardized there is not any data available for them. For this reason there is a decided advantage in purchasing the pure grains, although it

must be said that there are a number of reliable firms placing good compounded feeds upon the market.

How to Use Table No. 3.

Only the digestible nutrients are of value and so in comparing two feeds we should compare just the digestible nutrients. Suppose we had a cottonseed meal which analyzed 38 per cent protein. The table shows cottonseed meal protein to be 84 per cent digestible. We then would have 84/100 of 38 lbs., or 31.9 lbs. of digestible protein per 100 lbs. If a wheat bran analyzed 15 per cent protein, we see from the table that it is 78 per cent digestible and we would have 78/100 of 15 or 11.7 lbs. of digestible protein. The cottonseed meal would then have 31.9 lbs. compared with 11.7 in the wheat bran.

How to Figure the Comparative Value of Feeds from the Chemical Analysis.

Because such factors as palatability, digestibility, etc., play an important part in determining the value of feedstuffs it is difficult to make exact comparisons in their value from a chemical analysis. The analysis will, however, serve as a very valuable guide. Since the farmer can usually raise carbohydrates cheaper than he can purchase them he is chiefly interested in buying the concentrated feedstuffs for their protein and fat content.

Feeds may be compared upon the basis of the number of pounds of protein and fat which one dollar will buy. An example is as follows: Feed number 1 sells for $2.65 and is guaranteed protein 15.00 per cent, fat 4.00 per cent. If it contains 15.00 per cent protein there are 15 lbs. of protein in 100 lbs. of feed costing $2.65. Then one dollar buys 15÷2.65 or 5.6 lbs. of protein and 4.00÷2.65 or 1.5 lbs. of fat.

Feed number 2 sells for $4.10 and is guaranteed 17 per cent protein and 3 per cent fat. Then one dollar buys 17÷4.10 or 4.1 lbs. of protein and 3÷4.10 or 0.7 lbs. of fat.

In other words, in feed number one the consumer receives nearly 50 per cent more protein and twice as much fat per dollar as in feed number two. These figures represent two feeds of the same type which were sold in New Hampshire in 1920. In comparing feeds of the same class this method shows fairly accurately their relative value. When feeds of different types, like a cottonseed and a hominy feed, are compared, the digestible protein figures should be compared and the carbohydrates must also be taken into consideration.

Table Number 4 shows the average number of pounds of protein and fat that one dollar would buy for all of the feedstuffs analyzed in 1920.

TABLE NUMBER 4.

Class.	No. of Lbs. of Protein $1.00 will buy.	No. of Lbs. of Fat $1.00 will buy.
Alfalfa Meals	4.7	0.7
Beet Pulps	2.0	0.2
Brewer's Dried Grains	5.1	2.0
Calf Meals	4.7	1.4
Compounded Feeds	3.6	1.1
Cottonseed Meals	8.5	1.7
Dairy Feeds	5.8	1.4
Flaxseed Meals	7.2	1.5
Gluten Feeds	6.9	0.9
Hog Feeds	7.1	1.6
Hominy Feeds	3.0	1.7
Miscellaneous	5.5	1.3
Molasses Feeds	3.2	0.8
Oat Feeds	3.4	1.1
Poultry Feeds	5.5	1.4
Wheat Feeds	5.1	1.4

An inspection of this table will show the importance of buying your feeds according to their analysis. *Buy your feeds intelligently.*

Balancing the Ration.

It is not the purpose of this bulletin to furnish a practical treatise upon feeds and feeding. The Tables Nos. 5 and 6 are inserted here as a guide to the practical feeder. If you are not able to use them, ask your county agent to write to the New Hampshire College or the State Department of Agriculture for help. Feed intelligently. It will pay.

Some Suggestions in Purchasing Feeds.

1. A good feed is high in protein and fat, and low in crude fiber.

2. Poor feeds are low in protein and fat, and high in crude fiber.

3. Usually the more concentrated feeds are the most economical.

4. When comparing feeds of the same type, if they are sound, buy the one which offers the largest number of pounds of fat and protein for one dollar.

5. Compare the cost of feeds with their analysis, even within the same class, and buy the feeds which offer the greatest value per dollar.

6. Beware of misleading brand names, indicating unusual feeding value. Let the analysis rather than the brand name be your guide.

7. If you grow roughage for your dairy cattle, you can grow your carbohydrates cheaper than you can purchase them.

8. If you grow legumes or high protein crops for roughage you will need to buy less of the expensive protein feeds.

TABLE NUMBER 5.

Modified Wolff-Lehmann Feeding Standards for Farm Animals.

(Taken from "Feeds and Feeding" by Henry and Morrison)

	Digestible crude protein.	Total digestible nutrients.
1. Dairy Cows:		
For maintenance of 1,000 lbs. cow...	0.700 lb.	7.925 lb.
To the allowance for maintenance add		
For each lb. of 2.5 per cent milk.....	0.045–0.053	0.256
For each lb. of 3.0 per cent milk.....	0.047–0.057	0.286
For each lb. of 3.5 per cent milk.....	0.049–0.061	0.316
For each lb. of 4.0 per cent milk.....	0.054–0.065	0.346
For each lb. of 4.5 per cent milk.....	0.057–0.069	0.376
For each lb. of 5.0 per cent milk.....	0.060–0.073	0.402
For each lb. of 5.5 per cent milk.....	0.064–0.077	0.428
For each lb. of 6.0 per cent milk.....	0.067–0.081	0.454
For each lb. of 6.5 per cent milk.....	0.072–0.085	0.482
For each lb. of 7.0 per cent milk.....	0.074–0.089	0.505

TABLE NUMBER 6.

(Taken from "Feeds and Feeding" by Henry and Morrison.)

	Per day per 1,000 lbs. live weight.			
	Dry Matter.	Digestible Crude Protein.	Total Digestible Nutrients.	Nutrient Ratio.
	lb.	lb.	lb.	1:
Fattening 2-year-old steers on full feed.				
First 50-60 days	22.0–25.0	2.0–2.3	18.0–20.0	7.0– 7.8
Second 50-60 days	21.0–24.0	1.9–2.3	17.0–19.5	7.0– 7.8
Third 50-60 days	18.0–22.0	1.2–2.1	16.0–18.5	7.0– 7.8
Ox at rest in stall	13.0–21.0	0.6–0.8	8.4–10.4	10.0–16.0
